

# Design sketch

## Prioritization iteration 1

### What is it about?

The page above show the tasks created by the user and the date is next to it. The tasks are prioritized with the “!” sign so it means this is the most important task. As interviewees cared so much about prioritization.

The check icons are used when they complete one of these tasks.

The plus icon is used to edit or add a new task to the list

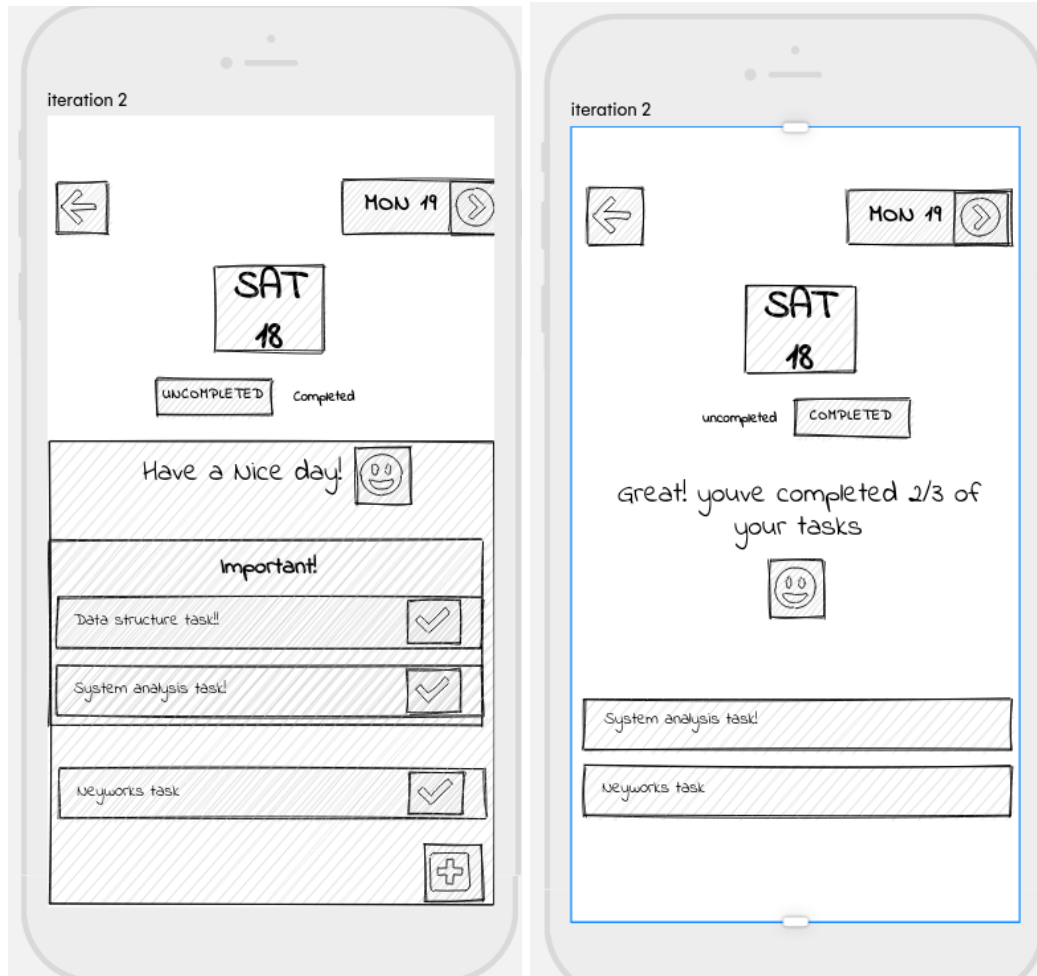

### **Action for users to take**

The user can add a task from the plus icon and choose whether it is an important task and or not and choose the date they want then the to-do list will be displayed just like the picture above. Users can check tasks whenever they finish their task and they are free to undo the checking part.

### **Research findings applied to the design**

One of the key findings extracted from the interviews is that we used in the design is to prioritize the tasks so the user can differentiate between the most important tasks and the less important tasks.

## **Prioritization and Motivation iteration 2**

### Design principles applied

- The design is clear and each page is specified for just one day with its tasks and important tasks are much clearer.
- Motivational statements = emotional design help users to be motivated when they complete their tasks

### Design rationale

- The clarity in prioritization will make the user differentiate between the important tasks and the normal tasks, unlike the previous design the “!” sign isn’t clear and user might not notice it
- Users have choices whether to go to the next day and add new tasks without having them on the same page
- Users can display the completed and uncompleted tasks separately to avoid distraction and confusion

- Motivational statements will be displayed for each section the completed section encourages them to complete their tasks and helps them to know how many tasks they completed.
